44 </div>

```

The `id` of a `labelable` form-related element in the same document as the `<label>` element. The first element in the document with an `id` matching the value of the `for` attribute is the *labeled control* for this label element, if it is a labelable element. If it is not labelable then the `for` attribute has no effect. If there are other elements which also match the `id` value, later in the document, they are not considered.

**Note:** A `<label>` element can have both a `for` attribute and a contained control element, as long as the `for` attribute points to the contained control element.
